

Perceived Income Risks

Tao Wang
Johns Hopkins University

March 30, 2020

Outline

- 1 Motivation
- 2 Stylized facts
 - Cross-sectional patterns
 - Perceived risks and decisions
 - Correlation with the stock market
 - Permanent/transitory decomposition (work in progress)
- 3 Model (work in progress)

Motivation

- Risks matter for individual decisions
 - precautionary saving
 - portfolio choice and stock market participation
- Risks matter for macroeconomic outcomes
 - Since idiosyncratic risks are not perfectly insured
 - Different wealth \rightarrow different MPCs \rightarrow distributional channel of macroeconomic policies
- Risks estimated from the inequality \approx “the truth” \approx perceptions?

This paper's agenda

- ① **Empirics:** subjective risk profiles from density surveys
 - differ systematically by **income, age, generation, and education**
 - affect **planned spendings**
 - non-normality, i.e half of population have **non-zero skewness**
 - **negatively correlate with stock market returns**
 - how persistent? (work in progress)
- ② **Theory:** a **subjective** heterogeneous-agent model
 - **imperfect understanding** of income process
 - i.e. experiences \rightarrow perceptual differences across age and generation
 - life-cycle consumption and portfolio choice
 - uninsured idiosyncratic risks (and aggregate risks)

Literature

- subjective survey, especially on probabilist surveys. [Manski \(2004\)](#), [Delavande et al. \(2011\)](#), [Manski \(2018\)](#), [Bertrand and Mullainathan \(2001\)](#), [Armantier et al. \(2017\)](#)
- “insurance or information”: [Kaufmann and Pistaferri \(2009\)](#), [Meghir and Pistaferri \(2011\)](#), [Pistaferri \(2001\)](#), [New York Fed Blog \(2019\)](#), [Flavin \(1988\)](#)
- consumption/saving and portfolio choice under imperfect perception/understanding. [Rozsypal and Schlafmann \(2017\)](#), [Carroll et al. \(2018\)](#), [Lian \(2019\)](#)
- expectation formation, mostly on macroeconomic variables, [Coibion and Gorodnichenko \(2012\)](#), [Fuhrer \(2018\)](#), etc
- counter-cyclical labor income risks: [Storesletten et al. \(2004\)](#), [Guvenen et al. \(2014\)](#), [Catherine \(2019\)](#)
- heterogeneous-agent New Keynesian models (HANK)

Data

Table: Survey of Consumer Expectations

Time period	2013M6-2019M6
Frequency	monthly
Sample size	1,300
Density variable	1-yr-ahead earning growth (same position/hours)
Pannel structure	12 months
Demographics	educ, income, age, gender, state

- density estimation following [Engelberg et al. \(2009\)](#)
- exclude top and bottom 1% values of each moment

Definition

- $\Delta Y_{i,t+12}$: next-year growth of the same job/position/hours
- Moments to look
 - expected growth, $E_{i,t}(\Delta Y_{i,t+12})$
 - variance: $\overline{var}_{i,t}(\Delta Y_{i,t+12})$
 - skewness: $skew_{i,t}(\Delta Y_{i,t+12})$
- Both perceived nominal and real income growth
 - $E_{i,t}(\Delta Y_{i,t+12}^r) = E_i(\Delta Y_{i,t+12}^n) - E_{i,t+12}(\pi_{t+12})$
 - $\overline{var}_{i,t}(\Delta Y_{i,t+12}^r) = \overline{var}_{i,t}(\Delta Y_{i,t+12}^n) + \overline{var}_{i,t}(\pi_{t+12})$
- Does not reflect unemployment risk
 - Can be converted into the unconditional risk using perceived unemployment risk (same-job-hour risk is just a lower bound).

Outline

1 Motivation

2 Stylized facts

- Cross-sectional patterns
- Perceived risks and decisions
- Correlation with the stock market
- Permanent/transitory decomposition (work in progress)

3 Model (work in progress)

Cross-sectional of income growth expectation

(a) expected growth of nominal

(b) expected growth of real

- nominal income: right-skewed and mostly positive
- real income: symmetric around zero

Cross-section of income risks

(a) nominal income risk

(b) real income risk

- average perceived income risks: 2.5% standard deviation for nominal and 3.5% standard deviation for real income
- just a lower bound: before adjustment of unemployment risk

Cross-section of tail risks

(a) nominal income skewness

- sizable dispersion in skewness, i.e. about half of the people have non-zero skewness in perceived income distribution.

Perceived income risks by household income

- Similar to the pattern of earning growth dispersion conditional on income in [Bloom et al. \(2018\)](#).

Perceived income risks by age

(a) risks

(b) skewness

- in line with existing findings, for instance [Bloom et al. \(2018\)](#).

Perceived income risks by generation

(a) risks

(b) skewness

Perceived income risks by education

(a) risks

(b) skewness

- not the same to findings, for instance [Meghir and Pistaferri \(2004\)](#)

Covariants of perceived income risks

Table: Perceived income risks and individual characteristics

Outline

1 Motivation

2 Stylized facts

- Cross-sectional patterns
- Perceived risks and decisions
- Correlation with the stock market
- Permanent/transitory decomposition (work in progress)

3 Model (work in progress)

Underlying income process

- Income of individual i , cohort c at time t

$$y_{i,c,t} = p_{i,c,t} + \epsilon_{i,c,t}, \quad \text{where } \epsilon_{i,c,t} \sim N(0, \sigma_{c,\epsilon}^2)$$

$$p_{i,c,t} = p_{i,c,t-1} + \theta_{i,c,t}, \quad \text{where } \theta_{i,c,t} \sim N(0, \sigma_{\theta,c,t}^2)$$

$$\log \sigma_{\theta,c,t}^2 = \rho_c \log \sigma_{\theta,c,t-1}^2 + \mu_{\theta,c,t}$$

$$\mu_{\theta,c,t} \sim N(0, \gamma_c^2)$$

- Parameters for cohort c

- ρ_c : how persistent is the innovation to the permanent risk
- γ_c : how large is the innovation to the size of permanent risk
- $\sigma_{c,\epsilon}$: the time-invariant size of the transitory risk

From montly to yearly

- Under a perfect understanding of the income process
- Perceived risks about **next-month** growth $\Delta y_{i,t}$

$$\begin{aligned}\overline{var}_{i,t}(\Delta y_{i,t+1}) &= E_{i,t}(\sigma_{\theta,t+1}^2) + \sigma_{\epsilon}^2 \\ &= \rho e^{-0.5\gamma} \sigma_{i,\theta,t}^2 + \sigma_{\epsilon}^2\end{aligned}$$

- Perceived risks about **next-year** growth $\Delta Y_{i,t}$

$$\begin{aligned}\overline{var}_{i,t}(\Delta Y_{i,t+12}) &= \sum_{k=1}^{12} (12 - k + 1)^2 E_{i,t}(\sigma_{\theta,t+k}^2) + 12^2 \sigma_{\epsilon}^2 \\ &= \sum_{k=1}^{12} (12 - k + 1)^2 \rho^k e^{-0.5k\gamma} \sigma_{i,\theta,t}^2 + 12^2 \sigma_{\epsilon}^2\end{aligned}$$

Perceived permanent and transitory decomposition

- ① SMM estimation using the following moments of perceptions
 - average perceived risks, variance, autocovariance across the whole population or within specified cohort
- ② A breakdown of perceived risks into permanent and transitory components

Model ingredients

- ❶ imperfect understanding of the income process, a deviation from rational expectation benchmark.
 - experience-based learning capturing the cross-generation and age-dependence income perceptions
- ❷ a finite life cycle with a constant probability of death
- ❸ uninsured idiosyncratic risks and aggregate risks (the workhorse assumption of the HANK literature)
- ❹ single asset, i.e. no distinction between liquid and illiquid assets

Intuitions behind the model mechanisms

- an imperfect understanding → heterogeneous perception of risks
AND uninsurance of risks → difference in precautionary motives and MPCs across populations → potential amplification of aggregate MPC

Covariants of expected income growth
